This introduction to atomic and molecular physics explains how our present model of atoms and molecules has been developed over the last two centuries, both by many experimental discoveries and from the theoretical side by the introduction of quantum physics to the adequate description of micro particles. It illustrates the wave model of particles by many examples and shows the limits of classical description. The interaction of electromagnetic radiation with atoms and molecules, and its potential for spectroscopy, is outlined in more detail, and in particular, lasers as modern spectroscopic tools are discussed more thoroughly. Many examples and problems with solutions are offered to encourage readers to actively engage in applying and adapting the fundamental physics presented in this textbook to specific situations. Completely revised third edition with new sections covering all actual developments like photonics, ultrashort lasers, ultraprecise frequency combs, free electron lasers, cooling and trapping of atoms, quantum optics, and quantum information.
